What is Ipamorelin?

Ipamorelin a fascinating new muscle building discovery that is getting a lot of attention in the bodybuilding world. Like the GHRP6 peptide (releasing hexapeptide), it is a synthetic peptide that has powerful releasing properties. And these G'H' releasing properties are what is of interest to athletes and bodybuilders since they can make a tremendous difference in the amount of muscle you can grow and how quickly you burn fat.

How does it Work?

After an athlete administers Ipamorelin, a selective pulse is sent that stimulates the hypothalamus/pituitary to release GH. This pulse can endure for approximately three hours after injection. Once the GH pulse is sent, the cells go directly to the muscle to support development while staying clear of any possible bone or cartilage growth. This is good for Ipamorelin users, as long term usage will effect lean body muscle growth without the possibility of experiencing any bone or cartilage deformities. The same cannot be said for synthetic users, who experience pronounced side effect in swelling joints and even in some cases Carpel Tunnel. Ipamorelin will increase cell synthesis, elevate secretion levels of insulin from pancreatic tissue, and increase ghrelin in the stomach - which helps release GH and control hunger.

Function:

- Regulation of bodily growth
- Regulation of thyroid gland function
- Pain relief
- Regulation of temperature
